OPEN-WEB STEEL JOIST CONSTRUCTION

Floor construction shall consist of a poured in place concrete slab $2\frac{1}{2}$ in. thick (or other specified thickness) supported by properly designed steel joist spaced not over 24 in. on centers.

Roof construction shall consist of poured or precast concrete or gypsum, steel deck, wood plank or other suitable materials supported by properly designed steel joists spaced not to exceed the safe span of the roof material.

Ceiling construction shall consist of attached or suspended metal lath and plaster or acoustical tile.

DIMENSIONS AND PROPERTIES OF

As shown above, ceiling extensions, when required, are provided by extending one bottom chord bar at each end of the joist.

$t = \frac{1}{2}"$ for 16 S8, 18 S8, 20 S8, 22 S8, 24 S8

$t = \frac{3}{8}"$ for 14 S6, 14 S7, 16 S6, 16 S7, 18 S6, 18 S7, 20 S6, 20 S7, 22 S7

$t = \frac{1}{4}"$ for others.

Modern arc-welding or resistance-welding equipment is used in fabricating this joist. The top chord consists of pairs of hot-rolled angles, the bottom chord of pairs of round bars with the web made of a plain, round bar, bent to form a Warren-type truss. Ends of the joists are supported on plates arc-welded in place and located to provide a $2\frac{1}{2}$ -in. standard depth of bearing.

Bethlehem Open-Web Joists, "S" Series, are fully approved by, and subject to the quality control of, the Steel Joist Institute.

BETHLEHEM "S" SERIES JOISTS

Actual depths are nominal depths except for the 8 in. which is 8 $\frac{1}{4}$ in.

* Of chords only.

** Approximate weights per linear foot of joist include accessories and are for design purposes only.

(left) Seven-story residence wing, Peoria, Ill., Y.M.C.A. contains Bethlehem Open-Web Steel Joists. Architects: Gregg and Briggs; general contractor: Fred Harber's Sons; both of Peoria.

(insert) Steel joists in bank building in Easton, Pa., contribute to permanent fire-resistant construction. Architect: Hugh Moore, Jr., Easton; general contractor: Collins and Maxwell, Inc., also of Easton.

(bottom) Bethlehem joists are ideal for floor and roof structures in schools such as the Central Bucks School, Bucks County, Pa. Architects: Davis, Dunlap and Carver; general contractor: Wark and Co. Both are Philadelphia firms.

ARCHITECTS' SPECIFICATIONS

OPEN-WEB STEEL JOISTS

SCOPE—The contractor shall furnish and install all material to complete the open-web steel joist framing as shown on the drawings or as specified herein. The material shall include joists, bridging, anchors, headers, centering, temperature reinforcing in the concrete and miscellaneous steel framing between joists, not exceeding the joist spacing measured perpendicular to the joists.

JOISTS—Joists shall be Bethlehem Open-Web Steel Joists "S" Series or "L" Series, as approved by the Steel Joist Institute or other Institute approved joists.

The steel shall be made in open hearth or electric furnace and shall conform to the American Society for Testing Materials Standard Specifications for Steel for Buildings and Bridges ASTM A7.

Joists, "S" Series, shall receive a shop coat of asphalt base paint before shipment.

Joists, "L" Series, shall receive a shop coat of zinc chromate primer before shipment.

DESIGN—The design of steel joists shall conform to the most recent requirements of the Steel Joist Institute and have current approval of the Steel Joist Institute. The joist supplier shall furnish evidence of such approval, if required.

SPAN—The clear span of joists shall not exceed 24 times the depth. In floor construction, for spans greater than 32 ft the clear span shall not exceed 20 times the depth, and for spans less than 32 ft the clear span shall not exceed 21 times the depth.

LOCATION—In wall bearing construction, the clear distance between wall and first joist shall be approximately 4 in., for "S" Series joists, and approximately 6 in. for "L" Series joists.

In steel frame construction, the first joist shall be a full space from spandrel or wall beams. Where tie beams are at the same elevation as the joists and have moment of inertia and resisting moment not less than those of the joists, adjacent joists shall be a full space from such beams.

Where partitions extend across joists their weight must be included in the design load.

Where partitions occur parallel to joists an extra typical joist shall be provided under such partitions if necessary.

BEARING—Where joists rest on masonry or concrete supports, the length of bearing shall be not less than 4 in. for "S" Series joists and 6 in. for "L" Series joists.

Where joists rest on steel supports, the length of bearing shall be not less than 2½ in. for "S" Series joists and 4 in. for "L" Series joists, except where opposite joists butt over a narrow steel support and positive attachment is provided by welding or bolting, a shorter bearing length may be used if permissible stresses are not exceeded.

ANCHORS—Where joists rest on masonry walls the ends shall be thoroughly bedded in mortar. Every third "S" Series joist in floors and every "S" Series joist in roofs shall be anchored thereto with a ¾-in. round steel bar, and every "L" Series joist shall be anchored thereto with a ¾-in. round steel bar.

Where joists rest on steel beams, the ends of "S" Series joists shall be attached thereto by two welds 1 in. long, a ½-in. diameter bolt or a ¾-in. round steel anchor fastened over the beam flange. The ends of "L" Series

joists shall be connected thereto with two ¾-in. diameter bolts or welds of equal strength.

BRIDGING—For "S" Series joists, bridging shall consist of continuous horizontal bars not less than ½ in. round, 1 bar at top chord and 1 bar at bottom chord, attached by welding or by equal mechanical means. Bridging lines shall be located according to the following table.

Span	Number of Lines of Bridging
Up to 14 ft	one line near middle of span
14 ft to 21 ft	two lines at ⅓ points of span
21 ft to 32 ft	three lines at ¼ points of span
32 ft to 40 ft	four lines at ⅓ points of span
40 ft to 48 ft	five lines at ⅓ points of span

For "L" Series joists bridging shall consist of bolted cross bracing composed of not less than 1¼ x 1¼ x ⅓ angles. The l/r between connections shall not exceed 200. The maximum spacing of bridging lines for the different size joists shall be as listed below:

"L" Series Joist Type	Maximum Spacing of Bridging Lines
L03 to L08	10 ft-0 in.
L09 to L16	12 ft-0 in.
L17 to L19	16 ft-0 in.

Bridging shall be completely installed before any construction loads are placed upon the joists. The ends of all bridging lines terminating at walls or beams shall be anchored thereto.

CENTERING—Centering for poured concrete floor and roof slabs shall be Bethlehem Slabform. Slabform shall be furnished either unpainted or galvanized as required, and shall be attached to every joist at intervals not exceeding 24 in., in accordance with the manufacturer's instructions. If flexible centering is used provide sufficient blocking to prevent lateral strain on the top chord of the joists.

CAMBER—All "L" Series joists shall have camber.

INSPECTION—All steel joists shall be thoroughly inspected by the manufacturer before shipment to make certain that materials and workmanship conform to the requirements of these specifications. The manufacturer shall provide space in his shop for outside inspection if required.

HANDLING AND ERECTION—Care shall be exercised at all times to avoid damage through careless handling. Joists shall be unloaded from truck or car and stacked either by hand or by crane. Dumping onto the ground shall not be permitted.

As soon as joists are erected all bridging shall be completely installed and joists permanently fastened into place before the application of any loads.

In the case of "L" Series joists added precautions shall be taken that the hoisting cables be attached to top chord at panel points nearest the third points of the span, and not be released during erection until the bridging line nearest mid-span is installed and where joists are bottom bearing their ends have been restrained laterally.

During the construction period care shall be exercised to avoid excessive concentrated loads. The construction contractor shall provide means for the adequate distribution of such loads so that the capacity of any joist is not exceeded.

CONSTRUCTION ACCESSORIES FOR

BEAM ANCHOR

Welded anchorage is desirable where joists are supported on steel beams. When welding facilities are not available, beam anchors can be used. They are made of $\frac{3}{16}$ -in. steel rod and can be installed with an ordinary hammer.

END WALL ANCHOR

Where masonry or concrete walls support joists, rod anchors are used to secure the bearing ends to the walls. These anchors are made of $\frac{3}{8}$ -in. steel rod placed through the end of the joist and built into the wall.

HORIZONTAL BRIDGING

Bridging should be installed immediately after the joists are placed in the structure. This holds the joists in correct alignment and provides the necessary lateral bracing during construction.

SAG RODS

Where joists are used as purlins in a sloping roof, sag rods are required to transmit a component of the roof load to the ridge line.

BETHLEHEM "S" SERIES JOISTS

BRIDGING ANCHOR

(BRIDGING LINE NOT SHOWN)

Bridging anchors are required to secure the ends of bridging lines into masonry walls. Where a steel beam occurs at the end of a floor panel, however, the ends of bridging lines are field welded directly to the beam.

HEADER ANGLE

Small floor openings for shafts and ducts can be framed with header angles. The tail joist is attached to the header angle with bolts or beam anchors, which hold the header in position until the floor slab is placed on the joists.

OUTRIGGER

Outriggers are extensions to the top chords of joists for the support of overhanging roofs. They may be separate members shop-attached to the joists, separate members shipped loose and field-welded in place, or in cases of short overhangings and moderate loads, the top chord angles may be extended. For longer extensions and greater loads, the type of outrigger required is shown in the table at right.

Types 1 & 2—1 channel
Types 1A & 3—2 channels

"S" SERIES JOIST SIZES AND SPACINGS

RECOMMENDED FOR MAXIMUM ECONOMY AND STIFFNESS IN FLOORS

Joists listed first provide maximum economy.
When the joist listed first is in light type the joist listed second is recommended for stiffness.

When the joist listed first is in bold type it is recommended for stiffness and the one listed second is satisfactory for stiffness in the next shallowest depth.

To secure stiffer floors it is recommended that the clear span should not exceed 21 times the depth of the joist for spans 32'-0" and less and 20 times the depth of the joist for spans greater than 32'-0".

The Steel Joist Institute specifications permit span depth ratios of 24 for spans up to and including 32'-0" and 20 for spans over 32'-0".

DESIGN TABLE

"S" SERIES STEEL JOISTS

Note: Total safe loads consist of live loads plus dead load plus weight of joist. The dead load averages 40 psf where 2-in. concrete slabs are used, including 10 psf for plastered ceiling.

Maximum deflection for tabulated spans and safe loads will not exceed 1/360th of the span. Tabulated safe loads are based on joists being properly braced laterally as required for standard joist construction.

Design Tensile Stress 20,000 psi.

Joists designed to conform to the standards of the Steel Joist Institute.

Spacings over 24 in. shown to right of heavy vertical line are intended for roof construction only.

To secure stiffer floors it is recommended that the clear span should not exceed 21 times the depth of joist for spans 32'-0" and less, and 20 times the depth of the joist for spans greater than 32'-0".
